

Parallel Walk Ida

Blocking of opening by mistake

If your window is in ventilation position then the turn of handle can lead to opening by mistake. In this case scissors of the upper hinge go out of joining point and sash is hanging down, holding exclusively on the lower hinge. In order to avoid such situations the window hardware should be equipped with blocking device that will prevent from opening by mistake. This element will block the possibility of handle turn in case the sash isn't closed.
